[^1]: Academic Editor: Pradeep Sirohi The effect of transcutaneous electrical nerve stimulation on the respiratory functions in healthy subjects. To evaluate the effects of transcutaneous electrical nerve stimulation (TENS) on the respiratory functions in healthy subjects. The study population consisted of 30 healthy volunteers. TENS was applied to the bilateral upper trapezius muscles for 3 min. Resting spirometric parameters, inspiratory and expiratory muscle strength, maximal expiratory pressure, maximal inspiratory pressure, and peak expiratory flow were determined before and after stimulation. A significant improvement in spirometric parameters was observed after TENS. Maximal expiratory pressure and maximal inspiratory pressure were significantly increased. No change was observed in expiratory muscle strength or inspiratory muscle strength. Peak expiratory flow was significantly increased. TENS had no 82157476af
